

JET RACK MOUNTING KIT (JRMP1420) INSTALLATION INSTRUCTIONS

Highly recommended as the fastest – strongest – most versatile and dependable method to mount the hanger strut (sold separately) for your JET Rack® with confidence and ease the first time – and when installing multiple JET Racks® – every time! Our Universal Mounting Plate can be formed to fit any suitable mounting surface found in any van, truck cap, trailer or storage space. Guaranteed!

TOOLS YOU MAY NEED FOR INSTALLATION OF THE JRMP1420

Drill/Driver

½" Drill Bit

Screwdriver(s)

Tape Measure

Marker/Pencil

STEP BY STEP INSTRUCTION - PLEASE READ FIRST

- STEP 1:** Please refer to the instructions that come with your JET Rack® for locating your hanger strut mounting position and length. Instructions for both JET Rack® and Mounting kit may also be found online at jet-rack.com.
- STEP 2:** Once you determine strut position, find the center of each mounting point. Carefully drill a ½ inch relief hole into the material that you are mounting to. **Warning:** Be careful to avoid wiring, etc.! If you have a headliner of any type, you must carefully cut and peel back the material as necessary to install the plate flush against the surface. (you can fold the material back to its original position before installing strut).
- STEP 3:** Position the plate so that the protruding part/threaded side of the rivet nut enters the relief hole just drilled. The plate should now lie flat against the surface being attached to with the rivet nut threads inside.
- STEP 4:** Form the plate to fit around your mounting surface by bending, pressing, or gently peening the material with a mallet, soft hammer, or another suitable tool. You may wish to install some screws in advance to help hold the plate in place as you work the material. Be creative, there are countless ways to achieve a good fit and a tight fit is always better here. **TRUCK CAP TIP:** The specialized perforation pattern was designed to allow for tool-free, hand bending of the plate to fit the common ¾"-1" square stock common used in the framework of many aluminum truck caps. If necessary, you can easily trim the plate with metal snips to shape and perfectly fit your particular application.
- STEP 5:** Install self-drilling screws. 8 screws per plate have proven to be more than adequate but you may install more of your own if you choose. Be sure that you do not install screws where the screw head will prevent the strut from being flush with the plate when fully installed.
- STEP 6:** Install the strut using the ¼"-20 screws, external tooth lock washer (lock washer between ¼"-20 screw and fender washer), and 1-1/4" fender washer. **IMPORTANT NOTE:** As indicated in the JET Rack Installation instructions, you may need to install your Sliding Mount BEFORE you attach the strut to the mounting plate to ensure clearance for entry into the end of the strut. About 4 inches of clear space at either end of your strut is required to insert Sliding Mount.
- STEP 7:** Install your JET Rack® according to instructions. When complete cut the corner of the White Lithium Grease packet and apply to the inner grooves of the Sliding Mount and the parts of the strut that make contact with the Sliding Mount during use.
