

Special Instructions for Monkey Bars - 2020 Edition

Unlike previous versions, the Monkey Bars - 2020 Edition come with screw-together cross bars. Assembling the bars is a simple process - the threaded connector is already screwed into one of the bars for each set.

To complete the assembly, first remove the protective plastic cap on the end of the threaded connector. Find the Lube Tube that came with your rack and put a drop or two on your fingertip. Spread the lube onto the exposed threads to create a thin film of lube. This will prevent the threads from seizing together once assembled so that you can unscrew the bars for easier storage or transport.

Now line up the threaded connector with the open bar end and thread the two pieces together. Continue until the threaded connector is fully seated in the bar (it should look like the other side that came preassembled from the factory). Give the bars a firm twist to complete the assembly - nothing more than hand pressure should be needed to make a secure connection.

Continue with steps in the Assemble Your Monkey Bars section of the manual to get the product ready for use.
